analyzers, (gas flow, ion sources, Recording systems.

Several improvements and new developments are
reported for the Atlas CH 3 mass spectrometer, which
have extended or promise to extend the analytical appli-
cations of this apparatus considerably. They have to do
with the gas inlet system and the gas flow through the
mass spectrometer, measures to increase the resolving
power, and a new recorder with the highest recording
speed. (Author)

Trans. of Radex Rundschau (Austria) 1955, no. 1,
p. 301-318.

The existing solutions of Fourier's differential equation for a nonstationary temperature field are combined into a simple approximation equation, from which it is possible to calculate with sufficient accuracy from the temperature conditions in the heat-storing elements the coefficients of heat transfer for the reversal half-periods. Graphical methods for doing this very simply are indicated. The dimensions of the various parts of regenerators, both with stationary and with moving (rotating) heat storage masses, are calculated. A method of working out the economic value of a regenerator is indicated, and with various assumptions which (Engineering--Mechanical, TT, v. 5, no. 2) (over)

This study of this reaction, conducted in the presence of anhydrous zinc chloride as catalyst, demonstrated the existence of an induction period. The duration depends on the degree of dehydration of the catalyst. It is completely avoided if aqueous solutions of the catalyst are used. (Chemistry--Physical, TT, v. 7, no. 5) (over)

DESCRIPTORS: *Desalination, *Sea water, *Freezing,
*Refrigerants, *Towers (Chemistry), *Butanes.

The freezing of a portion of the solvent is carried out
by means of an evaporable refrigerant. Liquid re-
frigerants non-miscible with salt solutions are brought
in direct contact therewith, whereby the refrigerant
evaporates while simultaneously the solvent separates
in solid form.
